

**STEP 1:**

In a well-lit area, tip the patient's head back.

**STEP 2:**

Place the key in the hole until it is firmly in place.

**STEP 3:**

Pushing the key toward the back of the mouth, you will notice the fender will rotate and the new hole will appear. The rotation stops when the key meets the back of the expander.

**STEP 4:**

By pushing back and down toward the tongue, remove the key. The next hole for insertion of the key should now be visible.
